CAPSTONE FINAL DEFENSE · SYSTEM BRIEF

HIRAYA Learning Center

An integrated multi-platform information system
for enrollment, teacher–parent coordination,
and student monitoring

Hiraya Kids Learning Center
Montalban, Rizal

Leave-behind for the panel
17 September 2026

This brief describes the running prototype: website, desktop, and mobile apps sharing one API and one MySQL database. It is not a claim that every planned module is finished.

1. What the system is

HIRAYA replaces disconnected paper, spreadsheets, and chat threads with one school record. Enrollment, students, parents, teachers, classes, schedules, attendance, session packages, progress notes, payments, announcements, and in-app messages all sit on the same student identity.

The center still runs as a prototype on a local machine. Super Administrators work on the website admin pages and the Electron desktop. Teachers and parents use the Expo mobile app. Children do not receive login accounts. Each learner must be linked to a parent.

Hiraya.Api (ASP.NET Core) → MySQL · hiraya_learning_center

One hub. Three clients. Same session. Same store.

Website

Public campus site and enrollment form. Super Admin operations at /admin.

Desktop

Electron control desk for Super Admin: roster, attendance "here today," teacher COE PDF, messages.

Mobile

Expo Go companion. Teachers: calendar, modules, tasks, news. Parents: child schedule, progress, alerts.

2. Who signs in

Role	Where they work	What they can do
Super Administrator	Website /admin and desktop	Full CRUD on school records, enrollment review, attendance, payments, announcements, website content, Certificate of Employment PDF
Teacher	Mobile (teacher tabs)	Own calendar and tasks, assigned students, published modules, news, messages to admin
Parent	Mobile (family tabs)	Linked children only: schedule, attendance view, progress, payments/alerts, messages to admin
Student / child	No account	Represented by a parent link. Cannot sign in.

> Teachers and parents are blocked from website /admin. Super Admin is the only role for the operations desk. Seed passwords used in development must be changed before any public hosting.

3. How the pieces connect

Clients never talk to MySQL directly. They call Hiraya.Api over HTTP. After login (*POST /api/auth/login*), the API issues an HMAC session token. Every later call sends *X-Hiraya-Session*. Most operational screens

still synchronize through *GET/PUT /api/store* — one JSON document of school records — plus dedicated routes for auth, public enrollment, messages, and profile photos.

Layer	Technology actually used
Public + admin website	Next.js (React) · apps/web
Desktop operations	Electron + Vite · apps/desktop
Mobile companion	Expo / React Native · apps/mobile
API	ASP.NET Core · backend/Hiraya.Api
Database	MySQL · hiraya_learning_center · EF Core
Shared models	TypeScript packages (@hiraya/types, api, utils, ui)

This stack replaced the earlier MAUI / Blazor hybrid client. The panel should treat React, Electron, Expo, and ASP.NET as the implemented system—not MAUI, Flutter, or Laravel.

4. Core workflows to demonstrate

1. **Public enrollment.** A family submits the website form. The application appears under Enrollment Recording. Super Admin reviews and can create the student plus parent link.
2. **Student on file.** Every learner needs a parent account. The roster shows grade/program, guardian, and status.
3. **Here today.** On Student management, Super Admin confirms the child is at the center. That writes attendance. If a session package exists, one session is consumed (remaining = total − used, never below zero).
4. **Teacher day.** Admin assigns classes, schedules, and tasks. The teacher sees them on mobile Calendar / Modules / News.
5. **Parent day.** The parent sees only linked children: times, progress notes, and center announcements.
6. **Staff document.** From Teachers Management, Super Admin downloads a Certificate of Employment as a real PDF file (not a print dialog).
7. **Messages.** Direct notes between Super Admin and a teacher or parent stay inside HIRAYA instead of Messenger.

5. Modules in the prototype

Area	In the running prototype	Still incomplete
People	Students, parents, teachers, parent–child link	Every student in the live roster is not yet fully parent-linked
Enrollment	Public form, review queue, approve/reject path	ISO survey scores not yet in Chapter 5

Area	In the running prototype	Still incomplete
School day	Classes, schedules, attendance, session packages	QR door scan is in the API, not the daily UI
Learning	Module records and publish/archive	Little lesson-file content yet
Home–school	Announcements, alerts, in-app messages, progress notes	Richer parent notifications and photo coverage
Office	Payments ledger, reports CSV, website editor, COE PDF	Uniforms, payroll, and full compliance tracker are labels, not finished products
Hosting	Local website :3000, API :5188, desktop, Expo	HTTPS, production secrets, public domain

6. Honest status for the panel

A live local check on 16 September 2026 showed a healthy API, Super Admin sign-in, and populated school records (students, teachers, programs, classes, schedules, and related tables). The public pages and /admin load. The work is a functioning thesis prototype, not a production school product.

> Overall completeness of the intended information system is about **70–75%**: the three clients and the hub exist and share data; evaluation (ISO/IEC 25010 walkthrough), full parent linking, module files, and hosting remain open. Do not present invented survey means.

7. Suggested live demo (8–10 minutes)

1. Open the public website: programs, How enrollment works, Start enrollment.
2. Sign in as Super Admin on /admin. Show Dashboard counts, then Student management and “Here today.”
3. Open a teacher workspace or Teachers Management and download one COE PDF.
4. On desktop (optional): same student list and attendance — prove it is the same database.
5. On a phone with Expo Go: teacher calendar or parent home for a linked child.
6. Stop. Name the gaps: ISO data, remaining parent links, production deploy.

8. One-sentence answers

Why three apps? The public needs a website, the director needs a wide operations desk, and teachers/parents need a phone. They must not keep separate student lists.

Where is the source of truth? MySQL through Hiraya.Api. If it is not in the store, it is not school of record.

Why no child login? Early childhood accounts are a risk and a burden. The parent represents the learner.

What is new versus spreadsheets? One identity, attendance that uses sessions, role-limited screens, and a downloadable staff certificate from the same teacher record.

HIRAYA Learning Center · System overview for final defense · Generated 16 September 2026 from the implemented React / Electron / Expo / ASP.NET prototype.
